Session - 13

AWS Sagemaker 2

Oct 28, 2026

Wispr Flow is an AI-powered voice dictation tool that converts your speech into clean, well-formatted text across the apps you use.

Here are a few ways you could use it:

- **While coding**: Dictate instructions to AI coding assistants such as Cursor, Claude, Codex, or Windsurf, including technical details, file names, and variable names.
- **While prompting AI**: Explain your problem naturally and provide more context instead of spending time typing out every detail.
- **While communicating**: Draft Slack messages, emails, notes, and documentation through voice, with automatic grammar corrections and formatting.
- **While working in Hinglish**: Convert Hinglish prompts into clean text.
- **While editing**: Use voice commands to rewrite, shorten, or reformat existing text.

The idea is to spend less time typing and more time thinking, solving problems, and building things.

As part of your Scaler learning experience, you can access **3 months (90 days)** of Wispr Flow for free, instead of the standard 15-day trial.

I'd encourage you to try it in your own workflow and see whether it makes your learning and development process more efficient. It's an opportunity to explore a productivity tool and decide how useful it is for you.

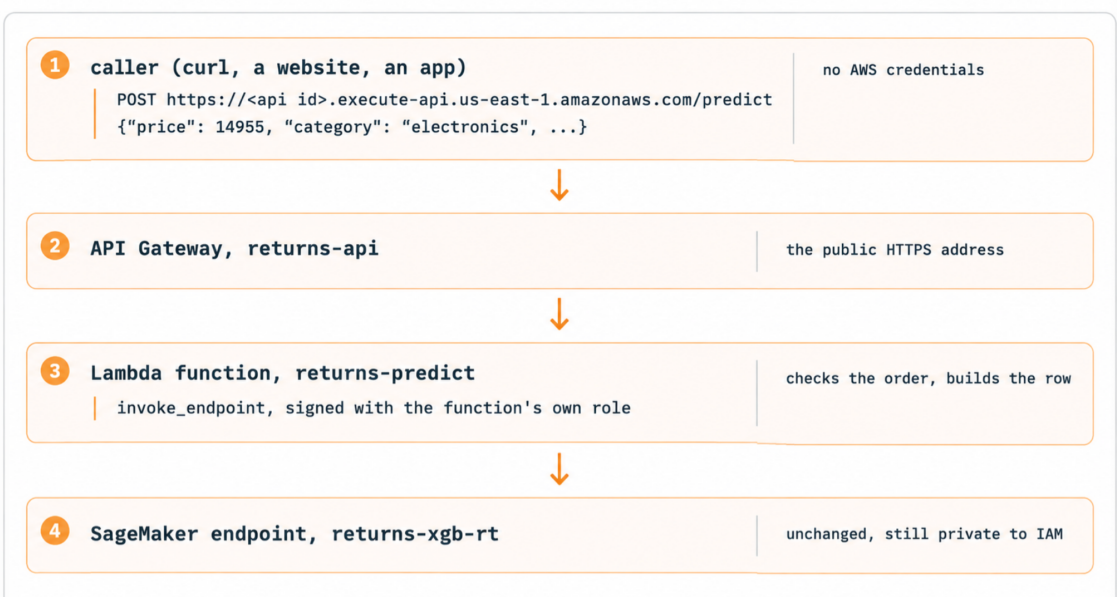

How to get started:

- Please use the promo code - "**SCALER**" under "settings" in "Plans & Billing" section.
- Already a user? Fill out this **form** with your registered email ID, and we'll help you claim your 3-month free extension to your subscription period.

You can also refer to the setup guide here: **Link**.

How Lambda works

Suppose you've written a Python function that predicts house prices.

1. You deploy your code: Upload a Python ZIP file or Docker container image.
2. A request arrives: AWS provides an isolated environment and executes your function.
3. Your function returns a response: The execution finishes.
4. No more requests: AWS may retain the environment for reuse or eventually remove it.
5. More requests arrive: AWS automatically provisions additional execution environments when needed.
